                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2107

The present sequence encodes a protein homologous to fungal saccharopine dehydrogenases. The specification describes a Corynebacterium dapA gene, which encodes a dihydrodipicalinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is contain a nucleic acid fragment encoding a DHDPS enzyme which is chloroplast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, especially in corn (Zea mays) and soybean
                                                                                                                                                                                                                                                                                                                                                    CDNA encoding protein homologous to fungal saccharopine dehydrogenases.

This nucleotide sequence encodes the lysine ketoglutarate reductase (LKR, see AAW87758), or saccharopine dehydrogenase (SDH), of Arabidopsis thallana. It was isolated on the basis of homology to fungal glutamate-forming SDH. Isolated nucleic acid fragments comprising sequences encoding all or part of plant LKR are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a suitable seed specific regulator, where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or activity is reduced due to a mutation in the gene encoding LKR or cransformation with the chimeric gene; (3) a nucleic acid fragment comprising; (1) chimeric gene above, and (i1) a second chimeric gene, in which a nucleic acid fragment encoding dihydrodipicolinic acid synthase (DHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chlorophast transit sequence and to a plant seed-specific regulatory sequence; (4) plants comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds

                                                                                                                                                                                                                                                                                                         from (3). The chimeric genes can be used to produce plant cells and seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR is important in controlling free lysine accumulation in plant seeds. LKR activity reduction may be achieved by cloning the claimed fragment, preparing a chimeric gene for cosuppression of LKR, expression of antisense RNA for LKR, and transforming plants with

This is the nucleotide sequence of a partial (3') cDNA encoding a rice lysine ketoglutarate reductase (LKR) or saccharopine dehydrogenase (SDH) polypeptide (see AAW87764). It was isolated dehydrogenase (SDH) polypeptide (see AAW87764). It was isolated nucleic arabit fragments comprising sequences encoding all or part of plant activity may also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a seed specific requiator, where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimeric gene; (3) a nucleic acid fragment comprising; (1) chimeric gene above, and (ii) a second chimeric gene, in which a nucleic acid fragment encoding dihydrodipicolinic acid synthase (DHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chlorophast transit sequence and to a plant seed-specific requiatory sequence; (4) plants comprising in genome (1), and (1), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells and seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR is conting reduction may be achieved by cloning the claimed fragment, preparing a chimeric gene for cosuppression of LKR, the chimeric gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expressed sequence tag; Fusarium venenatum; Aspergillus niger; Aspergillus oryzae; Trichoderma reesel; identification; recombination; culture condition; environmental stress; spore morphogenesis; metabolic pathway engineering; catabolic pathway engineering; ss.

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal the from the filamentous fungal in one or more second filamentous fungal the first filamentous fungal (FF) cell relative to expression of genes are used in the methods for monitoring differential expression of genes from FF cells allows the production of the global expression of genes from FF cells allows the production of the mathods for monitoring for the microorganisms to be improved. New genes may be clascovered, possible functions of unknown open reading frames can be discovered, possible functions of unknown open reading frames can be continued. The expression of genes can be used to study how FF cells captured. The expression of genes can be used to study how FF cells continued. The expression of genes can be used to study how FF cells captured for the monitored. The expression of genes can be used to study how FF cells captured for monitored. The expression of genes can be used to study how FF cells captured for the monitored of the method for monitored in the file of the method of the monitored of the farmaly equals one gene or open reading frame, and organisation of the moreover and the file of the gene products to facilitate confirms wenenatum; AAF11248 to AAF11247 represents ESTS from Aspergillus organism and an experience of the farmalysis from Aspergillus organism and an experience of the presents ESTS from Aspergillus and present invention.

This is the nucleotide sequence of the Arabidopsis thallana colly is the nucleotide sequence of the Arabidopsis thallana colly year ketoglutarate reductase (LKR)/saccharopine dehydrogenase (SDH) gene that includes exons coding for a 1064-amino acid (SDH) gene that includes exons coding for a 1064-amino acid corporate of plant LKR polypeptides are new. Also claimed are: (1) a corport of plant LKR polypeptides are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably confineric gene reduces LKR activity in plant seeds transformed with it; (2) and colliners of the activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the mutation in the gene encoding LKR or transformation with the collineric gene; (3) a nucleic acid fragment comprising: (i) chimeric gene; (3) a nucleic acid fragment comprising: (i) chimeric gene; (3) a nucleic acid fragment comprising; (i) chimeric gene; (3) a nucleic acid fragment comprising in seeds acid fragment encoding dihydrodipicolinic acid synthase (PHDPS) condemned (1), as second chimeric gene; (4) plants comprising in seeds peccific regulatory sequence; (4) plants comprising in corp., soppen, rapeseed, wheat and rice (claimed). LKR is corn, soppen, rapeseed, wheat and rice (claimed). LKR is cont, soppen, rapeseed, wheat and rice (claimed). LKR is important in controlling free lysine accumulation in plant seeds. LKR activity reduction may be achieved by cloning the claimed fragment, preparing a chimeric gene for cosuppression of LKR. Claim 3; Page 168-173; 231pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ahol: Morex (mla) plants were greenhouse grown in the R Wise lab at Iowa State University, Ames, IR. 7 day old green seedlings were infected with isolate 5874 of Blumeria grammins f. sp. hordel, and leaves were harvested 24, 48 and 72 hr post-incoulation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and I million pfu were in Vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence abover for more details on library preparation and
                                                                                                                                                                                                                                                                                                                                                                                                                       Hordeum vulgare
